

OBJECTIVES OF THE SURVEY

The Project “Statistical Users” implemented within the framework of the TACIS Program aims at the study of the statistical information users’ needs and, based on it, further improving the process of satisfying the needs. One of the main trends toward this end is to improve the statistical publications in future – to prepare diverse materials, to meet the statistical information users’ needs within the short time, as far as possible.

The statistical data dissemination includes the performance of diverse challenges – dissemination of analytical materials and statistical publications, as well as through the electronic versions and electronic mail.

It is possible to achieve reliable data in case if the relation between “information supplier and statistician” is based on the bilateral mutual confidence and respect.

The insurance of information responsiveness implies to provide the users with the information of required quality and volume in definite terms and developed way (hardcopy, magnetic medium, Internet, etc.).

The modern information technologies give the possibility to consider any users’ need. However, in this domain, the NSS of RA, as statistical office of any country, unavoidably faces the complexity of real restrictions of resources (financial, personnel, etc.)
