

PROBLEMS

The information user has not been yet using adequately the provided statistical information, as the user generally has not full knowledge on the statistical indicators and their calculation methodology. It could be increased through the extension of the relationship between statistician and user (through the meetings, press conferences, regular publishing of the methodological clarifications in the publications, etc.).

The main part of the information published by the NSS of RA is placed in the Internet. More widely application of the latter will enable to expand the scope of users, to pass from the paper version to electronic one. It is necessary to update regularly the periodical publications located in the Internet page and put new ones (firstly published materials, reports on surveys, etc.).

The automation of the Library is a very important stage. It is foreseen to introduce special software, through which it will be possible to use automatically information from the Internet and get it in any form. The user will have a possibility to work with the statistical database without assistance.

It is necessary to include more detailed data in the statistical information and make the periodicity more frequent. The statistical information should be accessible by the users.
