

## CONCLUSIONS

The XXI century requires information system development, increasing development of the statistics over the other spheres, decreasing of the uncertainty field that will increase the importance of the information.

It is important for the internal user and international public that the statistical information would be scientifically independent, unpolitical, impartial, accurate and reliable.

One of the priority directions for the statistics reformation is the updating of the experience in statistical information dissemination and policy of their maintenance, and the use of new approaches in this domain.

Only regular conduct of such surveys will give the opportunity to observe continuously the increasing and changing needs of the statistical user within the time and space, study and meet them.
