

9. POPULATION CENSUS OUTPUT TABLES DERIVATION

The Population Census output tables were derived by CENTS program of IMPS software, as at that time CSPro software didn't meet the requirement of derivation of output tables. However during the 10 years the CSPro software has been improved and was sufficient for the derivation of table of any complicity. Thanks to it the output tables of RA 2011 Population Census have been derived by the Crosstab program of CSPro software.

The CSPro software allows also to derive tables with different geographical codes. The software ensures the design of armenian tables, however they had been finally summarized in Microsoft Excel, since the Excel is an universal and flexible system.
